

Product Safety Recall

Product Description

Assorted Renegade and Renegade Industrial Portable Air Compressors sold between January 2013 and June 2016.

What is the defect?

The maximum design pressure and hydrostatic test pressures stated on the name plates are incorrect and state higher pressures than calculated by design drawings.

What is the hazard?

Although no incidents have been recorded, there is a possibility that after any form of modification to the compressor, its safety features or the pressure vessel, consumers may exceed the maximum pressure of the tank and may cause a rupture to the pressure vessel.

What to do

Consumers must not modify their compressors, safety features or the pressure vessel so that they produce more than 990kpa (143psi) of maximum stored pressure. Owners and users of the affected compressors should visit their nearest TradeTools store to arrange for a new rating plate with the correct lower pressure values to be affixed to their compressors.
